

SAP and SAP Concur integration: A better way to be the best

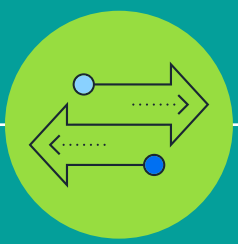

Your business systems work better when they work together. Integrating travel, expense, and invoice processes, for example, is vital. Integrating them with ERP is transformative. Simply put: **Travel, Expense, and Invoice solutions from SAP Concur feature native integration with your SAP ERP solutions. And that means business-changing value.**

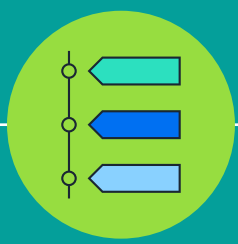

How does it work?

SAP ERP and SAP Concur solutions are continually in sync, so master data in both systems is always up to date.

Data flows back and forth via fully automated, encrypted, end-to-end data integration.

The ERP cost objects you select are automatically replicated in SAP Concur as often as you like.

Approved spend data is available for posting in near-real time and is automatically imported to your ERP.

SAP Cloud Identity Services manages access to both systems for a seamless and secure user experience.

What does finance get?

Crystal-clear, end-to-end visibility into all critical financial information—in near-real time.

Productivity goes up—because no one's manually moving data from A to B.

Employee reimbursements and vendor payments are faster—because the verified info is available instantly. This automation helps strengthen trust among your workforce and build loyalty with your suppliers, while allowing you to more accurately and efficiently reconcile general ledgers.

Forecasting and planning improve—because all your spending data from all your channels is always visible, all in one place, and it's updated in near-real time. And because you have instant, accurate info, you can quickly adapt to change.

Risk goes down and confidence goes up—because in-sync data across your systems dramatically reduces posting errors. If an error does occur, Concur automatically flags it so the user or admin can correct it.

What does IT see?

Trusted systems running together as one without extra work or worry.

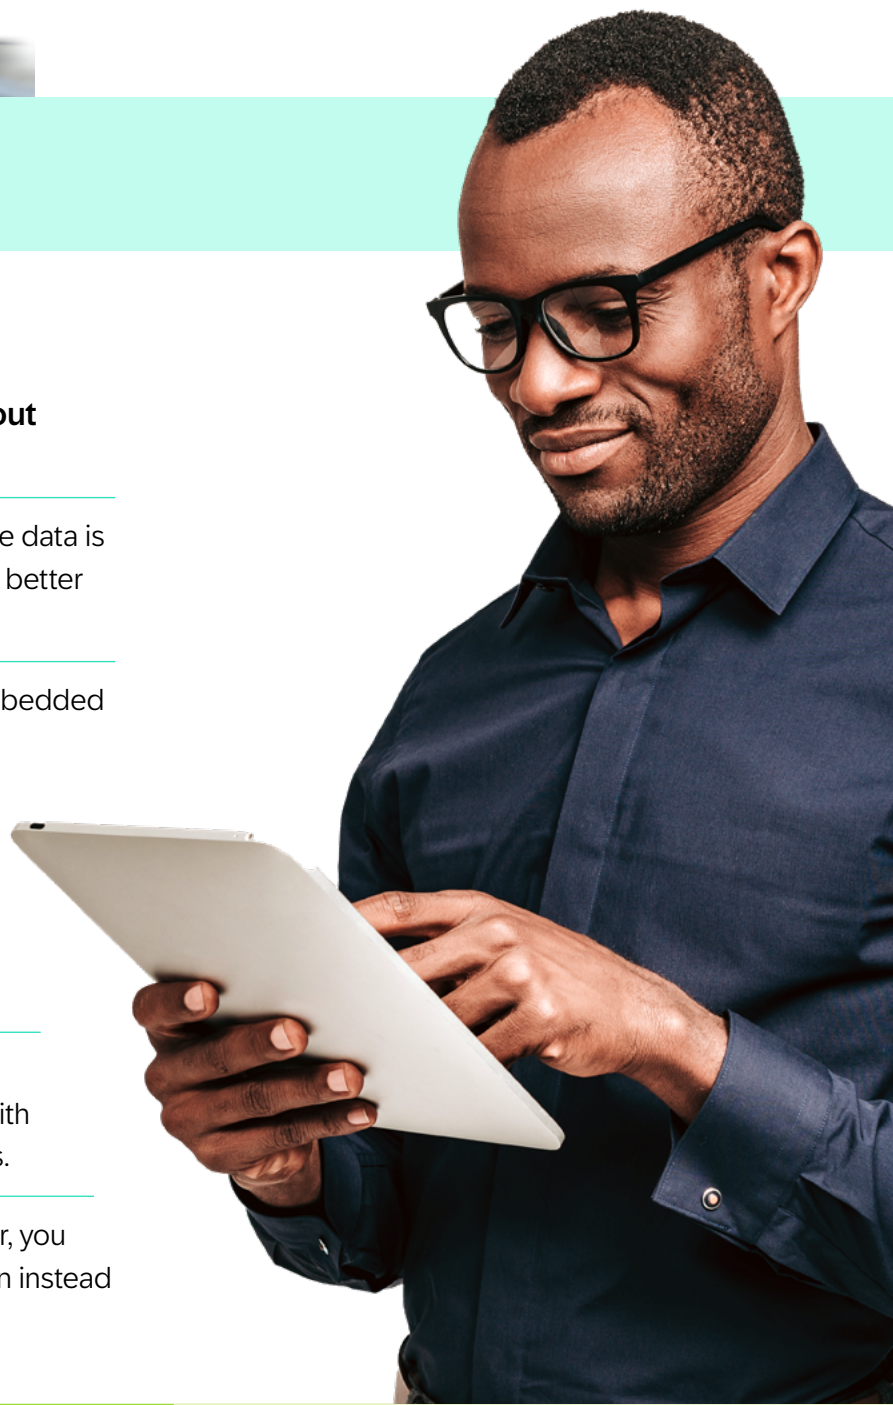

Data and system security gets stronger—because data is protected as it moves from app to app. You also have better control of identity authentication and provisioning.

System management gets easier—because of embedded data exchange monitoring, feedback loops, and error handling.

Integration is seamless—because there's no need for manual flat file exchange, building bridge programs, or mapping to APIs. SAP has already done the heavy lifting.

Updates are automatic—because all releases and upgrades are taken care of through SAP Cloud ERP, with no need for using middleware or updating connectors.

Costs go down—because as an SAP Cloud ERP user, you can hit the ground running with SAP Concur integration instead of starting at ground zero with a new implementation.
